## Wave-mean flow interactions

Separation between 'waves' and mean flows' in GFD:

- fast waves + slow motion,
- zonal mean + perturbation,
- resolved + unresolved.

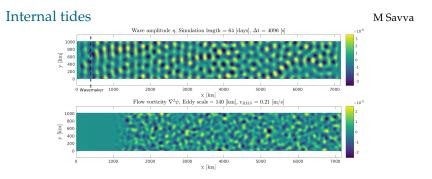

P 47.5 47. son Circulation

D'ASARO ET AL

2913

Zonal-mean atmospheric circulation

▲□▶ ▲圖▶ ▲ 国▶ ▲ 国▶ - 国 - のへで

Main interest is for the evolution of the mean flow, but this is influenced by wave feedback.

Wave-mean flow theories have been developed to:

- 1. obtain simple governing equations for the mean,
- 2. include wave feedback terms that can parameterised,
- 3. track particle motion (e.g. for heat transport),
- 4. preserve geometric structures (vorticity/potential vorticity conservation, energy conservation, wave action),
- 5. be valid in multiple regimes (non-perturbative).

Important: for flows that are balanced (controlled by PV),

3 + 4 = 1

Lagrangian averaging.

Eulerian mean flow: does not track particle motion.

Example: zero-mean, time-periodic flow,

$$\boldsymbol{u} = \varepsilon \boldsymbol{U}(\boldsymbol{x}, t), \qquad \bar{\boldsymbol{u}}^{\mathrm{E}} = \langle \boldsymbol{U} \rangle = 0$$

Particle position: expanding  $\mathbf{x}(t) = \mathbf{x}_0 + \varepsilon \mathbf{x}_1(t) + \varepsilon^2 \mathbf{x}_2(t) + \cdots$ ,

$$\varepsilon \dot{\mathbf{x}}_1 + \varepsilon^2 \dot{\mathbf{x}}_2 + \cdots = \varepsilon \mathbf{U}(\mathbf{x}_0 + \varepsilon \mathbf{x}_1 + \cdots, t)$$
$$= \varepsilon \mathbf{U}(\mathbf{x}_0, t) + \varepsilon^2 \mathbf{x}_1 \cdot \nabla \mathbf{U}(\mathbf{x}_0, t) + \cdots$$

Order by order,

$$\mathbf{x}_1(t) = \mathbf{\xi}(t) = \int^t \mathbf{U}(\mathbf{x}_0, s) \, \mathrm{d}s$$
: periodic displacement,

$$\langle \dot{\boldsymbol{x}}_2(t) \rangle = \bar{\boldsymbol{u}}^{\mathrm{S}} = \langle \boldsymbol{\xi} \cdot \nabla \boldsymbol{U} \rangle$$
: Stokes drift.

Wave-mean flow interactions Generalised Lagrangian mean, GLM Average 'following fluid particles': fix particle label *a*,

$$\mathbf{x}(\mathbf{a},t) = \mathbf{X}(\mathbf{a},t) + \boldsymbol{\xi}(\mathbf{X}(\mathbf{a},t)) \ .$$

Define the mean flow by

Andrews & McIntyre 1978

$$\langle \boldsymbol{\xi} \rangle = 0$$
 i.e.  $\boldsymbol{X}(\boldsymbol{a},t) = \langle \boldsymbol{x}(\boldsymbol{a},t) \rangle$ .

Lagrangian-mean velocity:

$$\dot{\boldsymbol{X}}(\boldsymbol{a},t) = \left. oldsymbol{ar{u}}^{ extsf{L}}(\boldsymbol{X},t) = \left\langle \boldsymbol{u}(\boldsymbol{X}+\boldsymbol{\xi}(\boldsymbol{X},t),t) 
ight
angle \,,$$

Average equations of motion:

- nice mean vorticity equation,
- not-so-nice mean momentum equation.

see Bühler 2014

白 医脊髓下的 医医外骨下

Generalised Lagrangian mean

GLM is coordinate dependent: basic definitions make sense only in Euclidean space,

 $\mathbf{x} = \mathbf{X}(\mathbf{a},t) + \mathbf{\xi}(\mathbf{X}(\mathbf{a},t)) \;, \;\; \bar{\mathbf{u}}^{\mathrm{L}}(\mathbf{X},t) = \langle \mathbf{u}(\mathbf{X} + \mathbf{\xi}(\mathbf{X},t),t) \rangle \;, \;\; \langle \mathbf{\xi} \rangle = 0 \;,$ 

- cannot add points,
- cannot add vectors at different points on a manifold M (e.g. sphere),

This is damaging:

- $x \in M$  but  $X \notin M$ ,
- $\nabla \cdot \boldsymbol{u} = 0 \text{ but } \nabla \cdot \boldsymbol{\bar{u}}^{\mathrm{L}} \neq 0.$

Take a geometric approach:

- avoid temptation of coordinate dependence,
- results valid on arbitrary manifolds,
- GLM made easy(?).

Geometric approach Notation

• use the flow map  $\phi_t$  to avoid confusing maps and points,

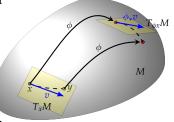

$$x = \phi_t a$$
,  $\dot{\phi}_t a = u(\phi_t a, t)$ .

• use lowercases,  $x \in M$ , implicit time dependence  $\phi = \phi_t$ .

Main tools: push-forward, pull-back and Lie derivative

$$(\phi_* v)^i = v^j \partial_j \phi^i, \ \phi^* = (\phi^{-1})_*,$$
  
 $\mathcal{L}_u v = \left. \frac{\mathrm{d}}{\mathrm{d}t} \right|_{t=0} (\phi_t)^* v.$ 

Focus on incompressible perfect fluid: volume preserving,  $\phi \in \text{SDiff}(M)$ .

▲□▶▲□▶▲□▶▲□▶ □ のQで

# Geometric approach

Notation

Consider an ensemble of flow maps  $\phi = \phi^{\alpha} : M \to M$ .

$$\blacktriangleright \ \alpha = 1, \cdots, N,$$

$$\blacktriangleright \ \alpha \in [0,2\pi], \ \phi^{\alpha}(x,t,\varepsilon^{-1}t) = \Phi(x,t,\varepsilon^{-1}(t-\alpha)),$$

*α*, realisation of a flow-map-valued random process.

This defines an average for vectors and other linear objects:

$$\langle v^{lpha} 
angle = N^{-1} \sum_{lpha=1}^{N} v^{lpha}, \quad \langle v^{lpha} 
angle = \int v^{lpha} \, \mathrm{d} lpha.$$

ション 人口 マイビン イビン トロン

Aim:

1. Define a a mean flow map:  $\bar{\phi} \in \text{SDiff}(M)$ ,

2. Derive dynamical equations for  $\overline{\phi}$ . Start with 2.

Good definition of  $\bar{\phi}$ :

- requires that  $\xi^{\alpha}$  remain close to id for  $t \gg 1$
- needs to be expressed in terms of  $\phi^{\alpha}$  or  $\xi^{\alpha}$ , not  $u^{\alpha}$ .

The mean velocity  $\bar{u}$  is defined by

$$\dot{\phi}x = \bar{u}(\bar{\phi}x)$$
, with  $\bar{u} \neq \langle u^{\alpha} \rangle$ .

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Chain rule:  $\dot{\xi}^{\alpha} \circ (\xi^{\alpha})^{-1} + \xi_*^{\alpha} \bar{u} = u^{\alpha}.$ 

Deduce  $\xi^{\alpha}$  when  $\overline{\phi}$  and hence  $\overline{u}$  are defined.

WAVE-MEAN FLOW	GEOMETRIC APPROACH	DYNAMICS	Mean flow	APPLICATION	CONCLUSION
000000	00	000000	00000	000	0

Write Euler equations in 'the right way':

$$\partial_t u + u \cdot \nabla u = -\nabla p \iff \partial_t u + u \cdot \nabla u + \nabla (u^2/2) = -\nabla (p - u^2/2).$$

Multiplying by d*x*:

$$\frac{\mathrm{d}}{\mathrm{d}t}(u\cdot\mathrm{d}x)=-\mathrm{d}\pi.$$

Geometrically, define momentum:

$$\blacktriangleright \ \nu = u \cdot \mathrm{d}x \ \text{in } \mathbb{R}^n,$$

$$\nu = g(u, \cdot) = u_{\flat}$$
 on general *M* with metric  $g(\cdot, \cdot)$ .

Momentum is a one-form, dual to vector:

$$u(v) = \sum 
u_i v^i \in \mathbb{R}$$

 $(\nu = \nu_i dx^i = g_{ij}u^j dx^i$  covariant;  $v = v^i \partial_{x^i}$  contravariant vector). Euler equations:

$$\partial_t \nu + \mathcal{L}_u \nu = -d\pi$$
,  $\operatorname{div} u = 0$ .

Wave–mean flow	Geometric approach	Dynamics	Mean flow	APPLICATION	Conclusion
000000	00	000€00	00000	000	0
Dynamics	,				

$$\partial_t \nu + \mathcal{L}_u \nu = -\mathbf{d}\pi$$
, i.e.,  $\frac{\mathbf{d}}{\mathbf{d}t} (\phi^* \nu) = -\mathbf{d} (\phi^* \pi)$ .

Why is this 'the right way'?

1. Kelvin's circulation theorem follows at once:

$$\oint_{\phi \mathcal{C}_0} \nu = \oint_{\mathcal{C}_0} \phi^* \nu = \text{const.}$$

2. The form emerges directly from the variational principle

$$\min_{\phi\in {\rm SDiff}(M)}\int_0^T {\rm d}t \int_M g(u,u)\omega\;.$$

Euler equations: geodesic motion on SDiff(M). Arnold 1966

3. The alternative  $\partial_t u + \nabla_u u = -\nabla p$  involves the covariant derivative  $\nabla_u$ .

WAVE–MEAN FLOW	Geometric approach	DYNAMICS	Mean flow	APPLICATION	CONCLUSION
000000	00	000000	00000	000	0

Mean dynamics: pull-back Euler equations with  $\xi^{\alpha}$ , then average (on mean configuration  $\bar{\phi}M$ ),

 $\langle \xi^{\alpha *} \left( \partial_t \nu^{\alpha} + \mathcal{L}_{u^{\alpha}} \nu^{\alpha} \right) \rangle = -\langle \xi^{\alpha *} d\pi^{\alpha} \rangle \iff \partial_t \langle \xi^{\alpha *} \nu \rangle + \mathcal{L}_{\overline{u}} \langle \xi^{\alpha *} \nu \rangle = -d(\cdots)$ 

Define Lagrangian mean momentum:  $\bar{\nu}^{\mathrm{L}} = \langle \xi^{lpha *} \nu^{lpha} 
angle$  , then

$$\partial_t \bar{\nu}^{\scriptscriptstyle L} + \mathcal{L}_{\bar{u}} \bar{\nu}^{\scriptscriptstyle L} = -d \bar{\pi}^{\scriptscriptstyle L}.$$

Mean Kelvin theorem follows:

$$\frac{\mathrm{d}}{\mathrm{d}t}\oint_{\bar{\phi}C_0}\bar{\nu}^{\mathrm{L}}=\mathrm{const.}$$

ション 人口 マイビン イビン トロン

#### Mean flow

Wave-mean flow interaction = relation between  $\bar{u}$  and  $\bar{\nu}^{L}$ .

Pseudomomentum:  $-\mathbf{p} = \bar{\nu}^{\mathrm{L}} - g(\bar{u}, \cdot)$ .

Closure: model to express p in terms of mean fields,  $\bar{\nu}^{L}$ ... (e.g. linear waves,  $\alpha$ -Euler).

#### Remarks:

For more complex fluid models, <sup>-L</sup> = ⟨ξ<sup>α\*</sup>·⟩ is the natural averaging for: buoyancy, potential vorticity, magnetic field...,

000000	oo	000000	000●0	000	0
Mean flow	V				

3. Geodesic

The Euler equations describe geodesics on SDiff(*M*) with metric  $D^{2}(\phi, \psi) = \inf_{\gamma_{s}:[0,1] \to \text{SDiff}(M)} \int_{0}^{1} \int_{M} g(\dot{\gamma}_{s}, \dot{\gamma}_{s}) \omega \, \mathrm{d}s, \quad \gamma_{0} = \phi, \ \gamma_{1} = \psi.$ 

Use this metric to define  $\overline{\phi}$  as a Riemannian centre of mass:

$$ar{\phi} = rgmin_{\phi\in {
m SDiff}(M)} \langle D^2(\phi,\phi^lpha) 
angle \; .$$

- $\partial_s q_s^{\alpha} + \mathsf{P} \nabla_{q_s^{\alpha}} q_s^{\alpha} = 0$ : Euler equations,
- $\langle q_s^{\alpha} \rangle = 0$  at s = 0, end condition.

Pertubatively:  $\langle q_1 \rangle = 0$ ,  $\langle q_2 \rangle = -\mathsf{P} \langle \nabla_{q_1} q_1 \rangle$ , same as optimal transport to leading order.

Wave–mean flow	Geometric approach	Dynamics	MEAN FLOW	Application	Conclusion

Mean flow	7				

4. glm

Soward & Roberts 2010

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

Take  $q_s^{\alpha} = q^{\alpha}$  to be *s*-independent:

$$\xi^{\alpha} = e^{q^{\alpha}}$$
 Lie group exponential,

with

$$\langle q^{\alpha} \rangle = 0.$$

Perturbatively:

$$\langle q_1 
angle = 0, \quad \langle q_2 
angle = 0, \langle \xi_1^i 
angle = 0, \quad \langle \xi_2^i 
angle = rac{1}{2} \langle \xi_1^j \partial_j \xi_1^i 
angle,$$

The simplest theory, but

- 'most' flows  $\xi^{\alpha}$  cannot be written as exponentials,
- still usable perturbatively.

## Application Inertia-gravity-wave-mean flow interactions

#### Start with 3D rotating, Boussinesq equations,

$$\begin{aligned} \partial_t \nu_{\rm a}^{\alpha} + \mathcal{L}_{u^{\alpha}} \nu_{\rm a}^{\alpha} &= -\mathrm{d}\pi^{\alpha} + \theta^{\alpha} \mathrm{d}z, \\ \partial_t \theta^{\alpha} + \mathcal{L}_{u^{\alpha}} \theta^{\alpha} &= 0, \quad \mathrm{div} \ u^{\alpha} = 0, \end{aligned}$$

with 
$$\nu_a^{\alpha} = \nu^{\alpha} + f(xdy - ydx)/2$$
.

PV (substance) conservation:

Haynes & McIntyre 1990

$$\left(\partial_t + \mathcal{L}_{u^{\alpha}}\right) d\nu_a^{\alpha} \wedge d\theta^{\alpha} = 0$$

Lagrangian average:  $(\partial_t + \mathcal{L}_{\bar{u}}) \, d\overline{\nu_a}^L \wedge d\overline{\theta}^L = 0$ .

# Application

Wave feedback of inertia-gravity waves

- assume  $u^{\alpha} = \underbrace{u_1^{\alpha}}_{\text{fast waves}} + \varepsilon u_2^{\alpha} + \cdots$ ,
- take  $\langle \cdot \rangle$  as fast-time average,
- $\bar{u}$  is geostrophically balanced:  $\bar{u} = (-\bar{\psi}_y, \bar{\psi}_x, 0)$ ,
- mean momentum:  $\bar{\nu}^{L} = -\bar{\psi}_{y} dx + \bar{\psi}_{x} dy + wave terms$  ,
- mean dynamics is controlled by Lagrangian-mean PV:

$$\begin{split} \partial_t \bar{q}^{\mathrm{L}} &+ \partial(\bar{\psi}, \bar{q}^{\mathrm{L}}) = 0 \\ \bar{q}^{\mathrm{L}} &= \left( \nabla^2 + \frac{f^2}{N^2} \right) \bar{\psi} \\ &+ \langle \partial(u_1, \xi_1) + \partial(v_1, \eta_1) \rangle + f \langle \partial(\xi_1, \eta_1) \rangle + f \nabla \cdot \langle \boldsymbol{\xi}_1 \cdot \nabla \boldsymbol{\xi}_1 \rangle / 2. \\ & \text{Holmes-Cerfon et al 2011, Xie & V 2015, Wagner & Young 2015, Salmon 2016} \end{split}$$

## Stimulated generation

#### Near-inertial waves

J-H Xie

Waves with  $(u, v, \cdots) \propto M(\mathbf{x}, \varepsilon t) e^{ift}$ .

Coupled model for M and  $q^{L}$  conserves action and energy:

$$\mathcal{A} = \int |M_z|^2 \,\mathrm{d}x = \mathrm{NIW}$$
 kinetic energy,

$$\mathcal{H} = rac{1}{2} \int \left( |
abla \psi|^2 + rac{f^2}{N^2} (\partial_z \psi)^2 + rac{N^2}{2} |
abla M|^2 
ight) \mathrm{d} x$$

= QG energy + NIW potential energy

Physical implications:

- A = const: no spontaneous NIW generation,
- $\mathcal{H} = \text{const:}$  mean-flow energy decays as  $|\nabla M|$  increases: stimulated wave generation

## Conclusion

- Revisit Andrews & McIntyre's GLM using geometric formulation to
  - obtain an incompressible mean flow,
  - mean trajectories constrained to M,
  - coordinate independence.
- ► natural definition of Lagrangian mean in terms of pull-back: τ<sup>L</sup> = ⟨ξ\*τ⟩,
- several definitions of the mean flow,  $O(\varepsilon^2)$  apart,
- mean circulation theorem is automatic,
- ► relation between  $\bar{u}$  and  $\bar{\nu}^{L}$  encodes wave-mean flow interactions,
- geodesic GLM + Taylor closure: Holm's  $\alpha$ -model. Oliver 2017
